Supplementary Fig. 1. Magnified HR-MRI of T2WI (a) and CE-T1WI (b) for dissecting left vertebral artery segment. The dissection flap (arrows points to both ends of flap on each slice) is seen on not only serial T2WIs but also CET1WI (from left to right in figure show cranio-caudal slices). Mural hematoma (arrowheads) in early subacute stage is detectable as high signal intensity lesion on CE-T1WI at medial side of double lumen. The lower line figures are added annotations to upper line figures for easily identifying the outer line of vessel walls (dashed lines), dissection flap (arrows) and hematomas (arrowheads).
